(54) Title: CONTROL OF GENE EXPRESSION

(57) Abstract

The present invention relates generally to a method of modifying gene expression and to synthetic genes for modifying endogen gene expression in a cell, tissue or organ of a transgenic organism, in particular a transgenic animal or plant. More particularly, the pres invention utilises recombinant DNA technology to post-transcriptionally modify or modulate the expression of a target gene in a c tissue, organ or whole organism, thereby producing novel phenotypes. Novel synthetic genes and genetic constructs which are capable repressing delaying or otherwise reducing the expression of an endogenous gene or a target gene in an organism when introduced there are also provided.
